cosmic ray
muons
and
atmospheric
neutrinos

confirmation!
flux of muon neutrinos
through the Earth

neutrinos of all flavors
interacting inside
IceCube

IceCube: transforms 1 km³ of natural Antarctic ice into a Cherenkov detector

highest energy muon energy observed: 560 TeV

- find contained events (420 Mton)

- total calorimetry

- complete sky coverage

- flavor determined

- some will be muon neutrinos with good angular resolution

loss in statistics is compensated by event definition

atmospheric neutrinos are accompanied by muons from the shower that produced them: none seen

(no signals in IceTop)

...and then there were 26 more...

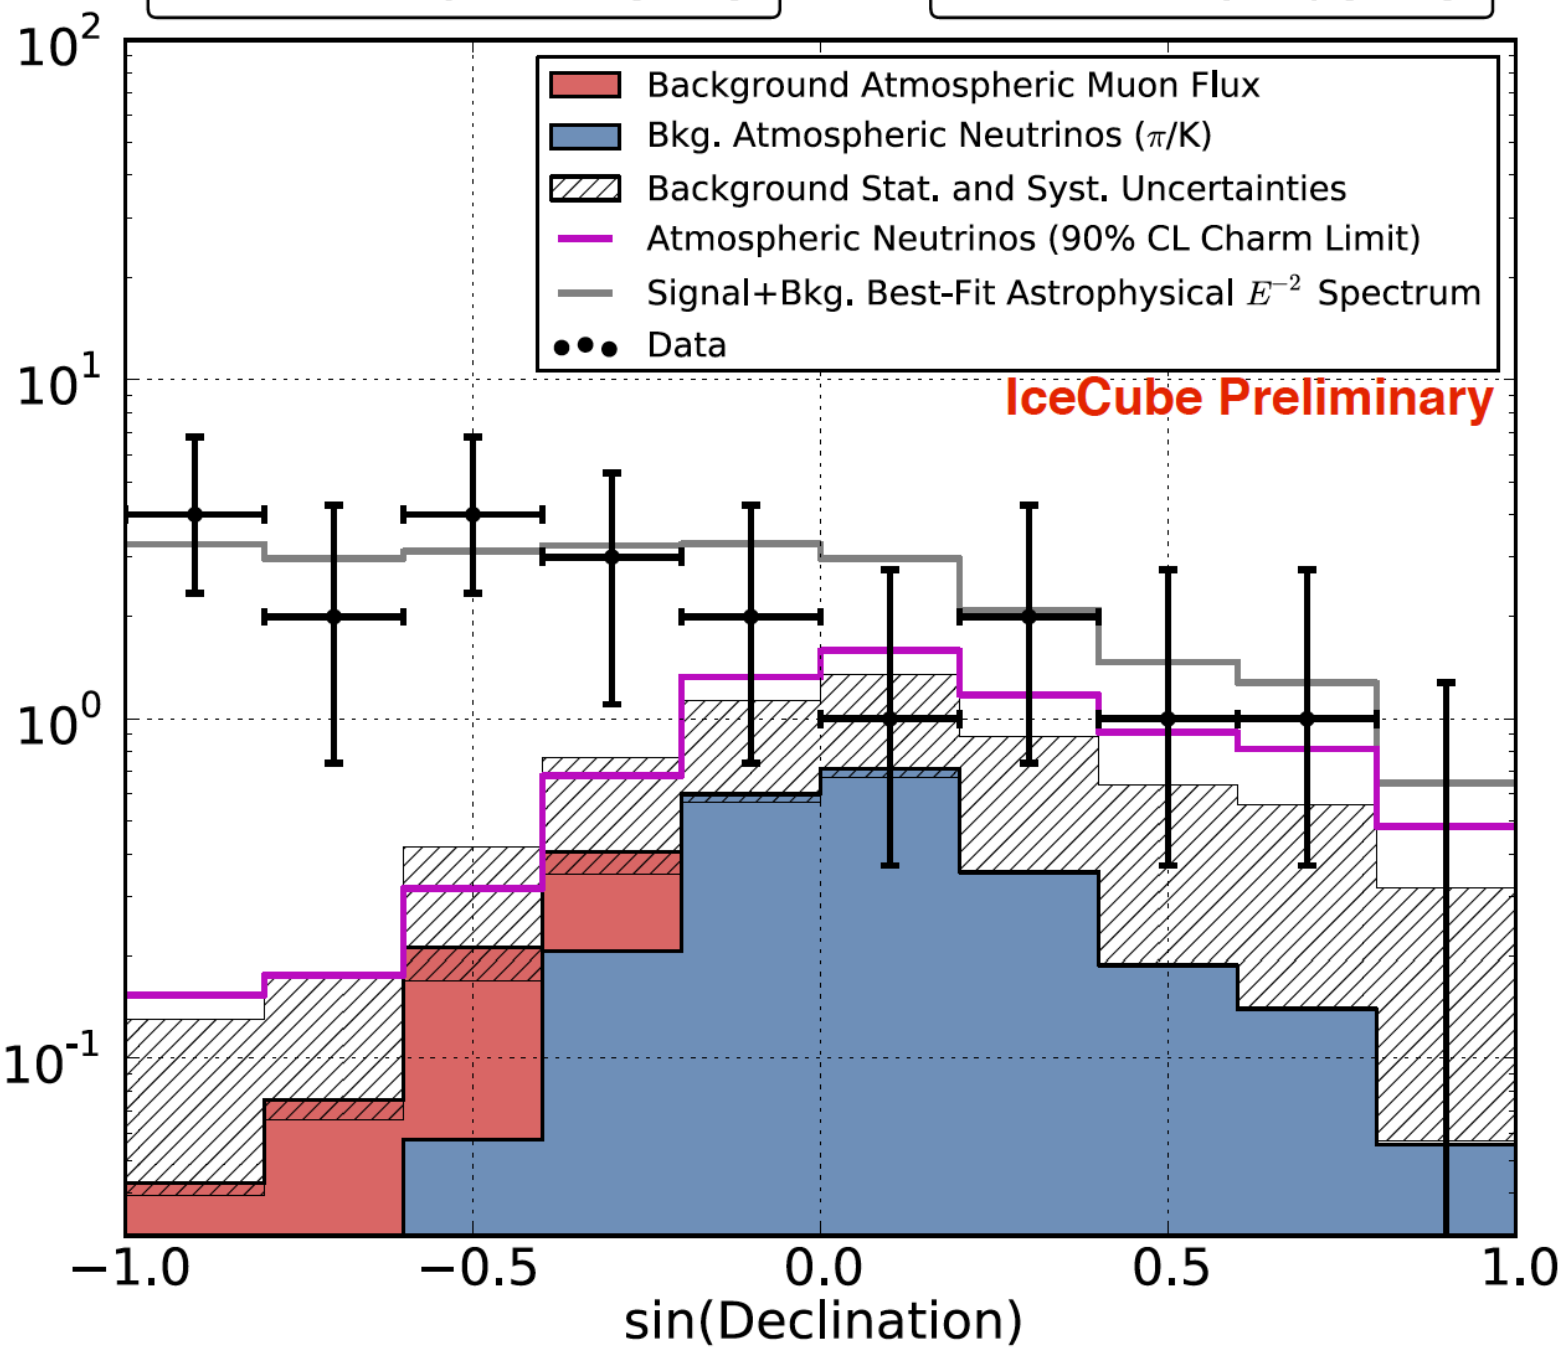

data: 86 strings one year

3 years

Events per 988 Days with deposited $E > 60$ TeV

Southern Sky (downgoing)

Northern Sky (upgoing)

Southern Sky (downgoing)

Northern Sky (upgoing)

IceCube performance

- 5160 optical sensors between 1.5 ~ 2.5 km
- 10 GeV to infinity
- < 0.5 degree on-line
 < 0.3 degree off line
for muon tracks
(10~15 degrees for showers)
- $< 15\%$ energy resolution

Digital Optical Module (DOM)

Differential Energy Reconstruction of 5 PeV Muon in IC-86

improving angular and energy resolution

physicsworld
**BREAKTHROUGH
OF THE YEAR
2013**

... for science and for the experimental accomplishment of building IceCube ...

Beyond IceCube

francis halzen

- the discovery of high-energy cosmic neutrinos
- where do they come from?
- neutrino stars?
- cosmogenic neutrinos
- beyond IceCube
- low threshold frontier (PINGU)

rationale for a kilometer-scale detector

$$\Phi_\nu \equiv \frac{dN}{dE} \approx \frac{1}{E^2}$$

sources that accommodate the observed energy budget

Galactic:
supernova remnants?

(source: Swordy – U.Chicago)

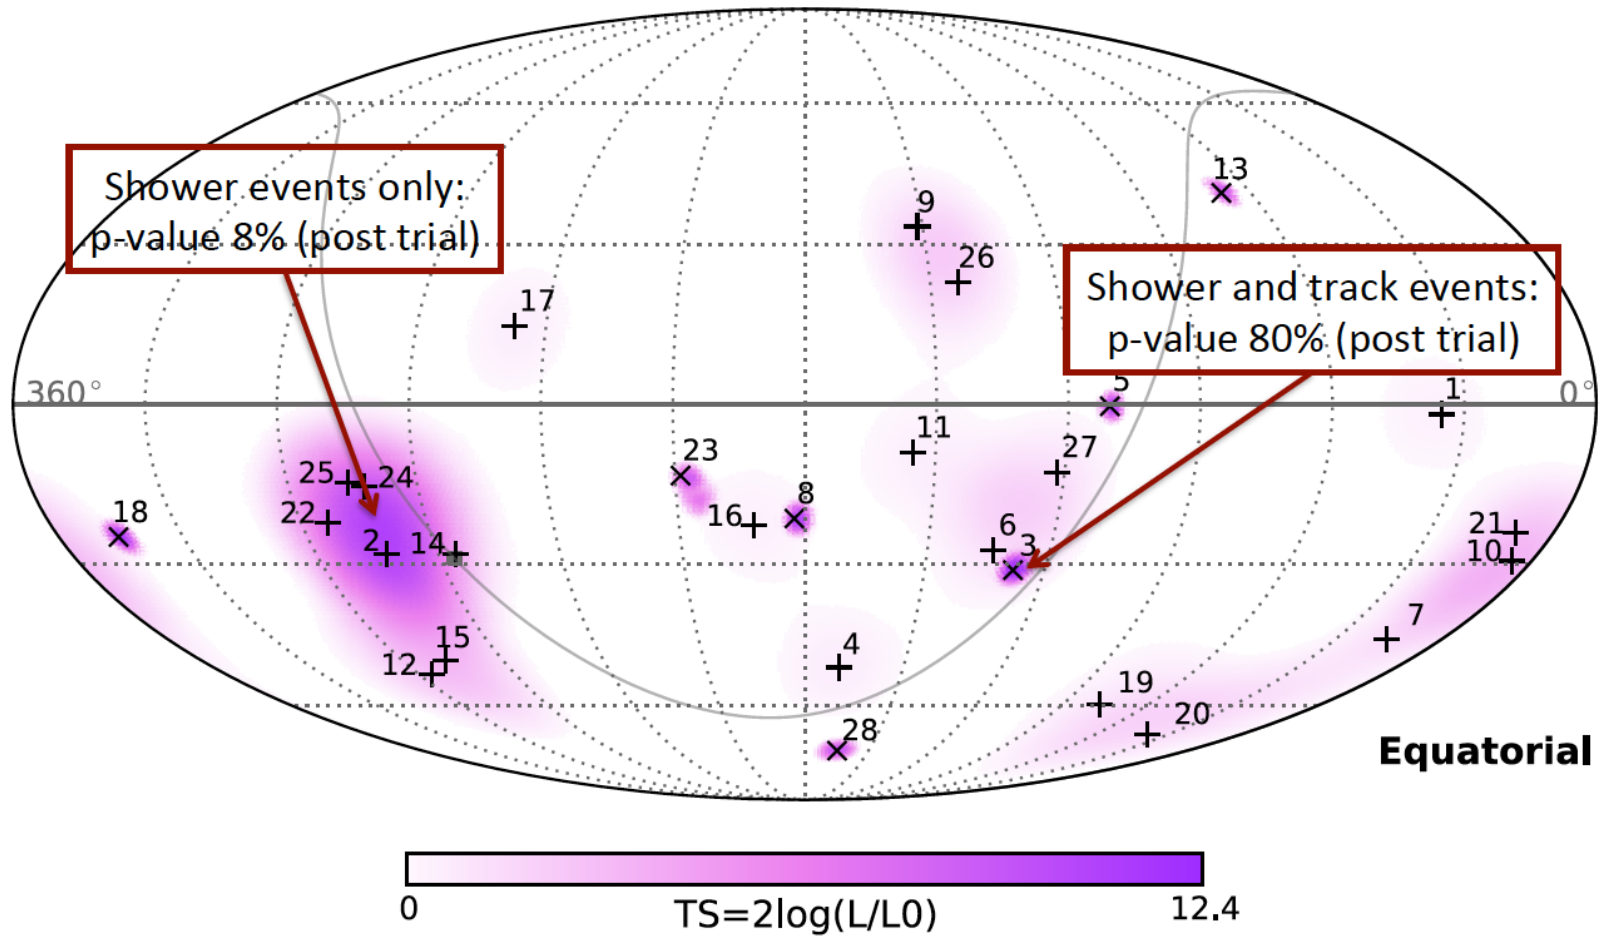

extragalactic:

- gamma ray bursts??
- active galaxies?

- cosmic neutrinos: energy > 100 TeV
- atmospheric background: 1~2 events per year

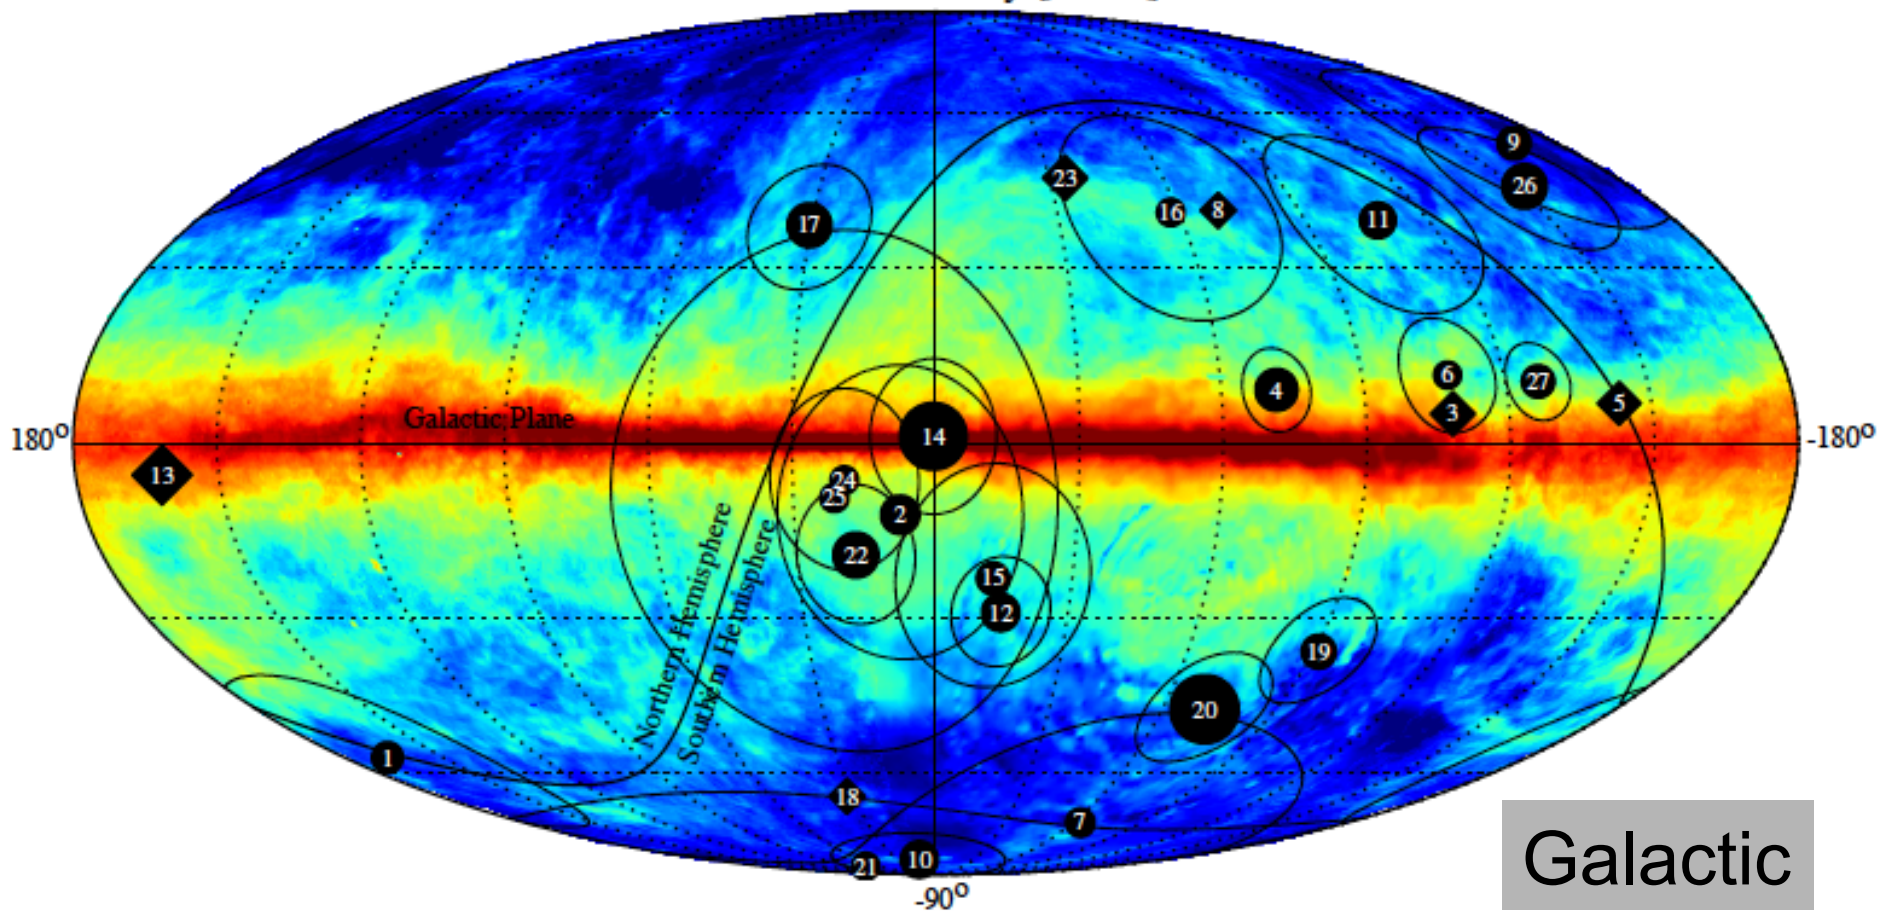

where do they come from?

where do they come from (3 year data)?

HI column density [cm^{-2}]

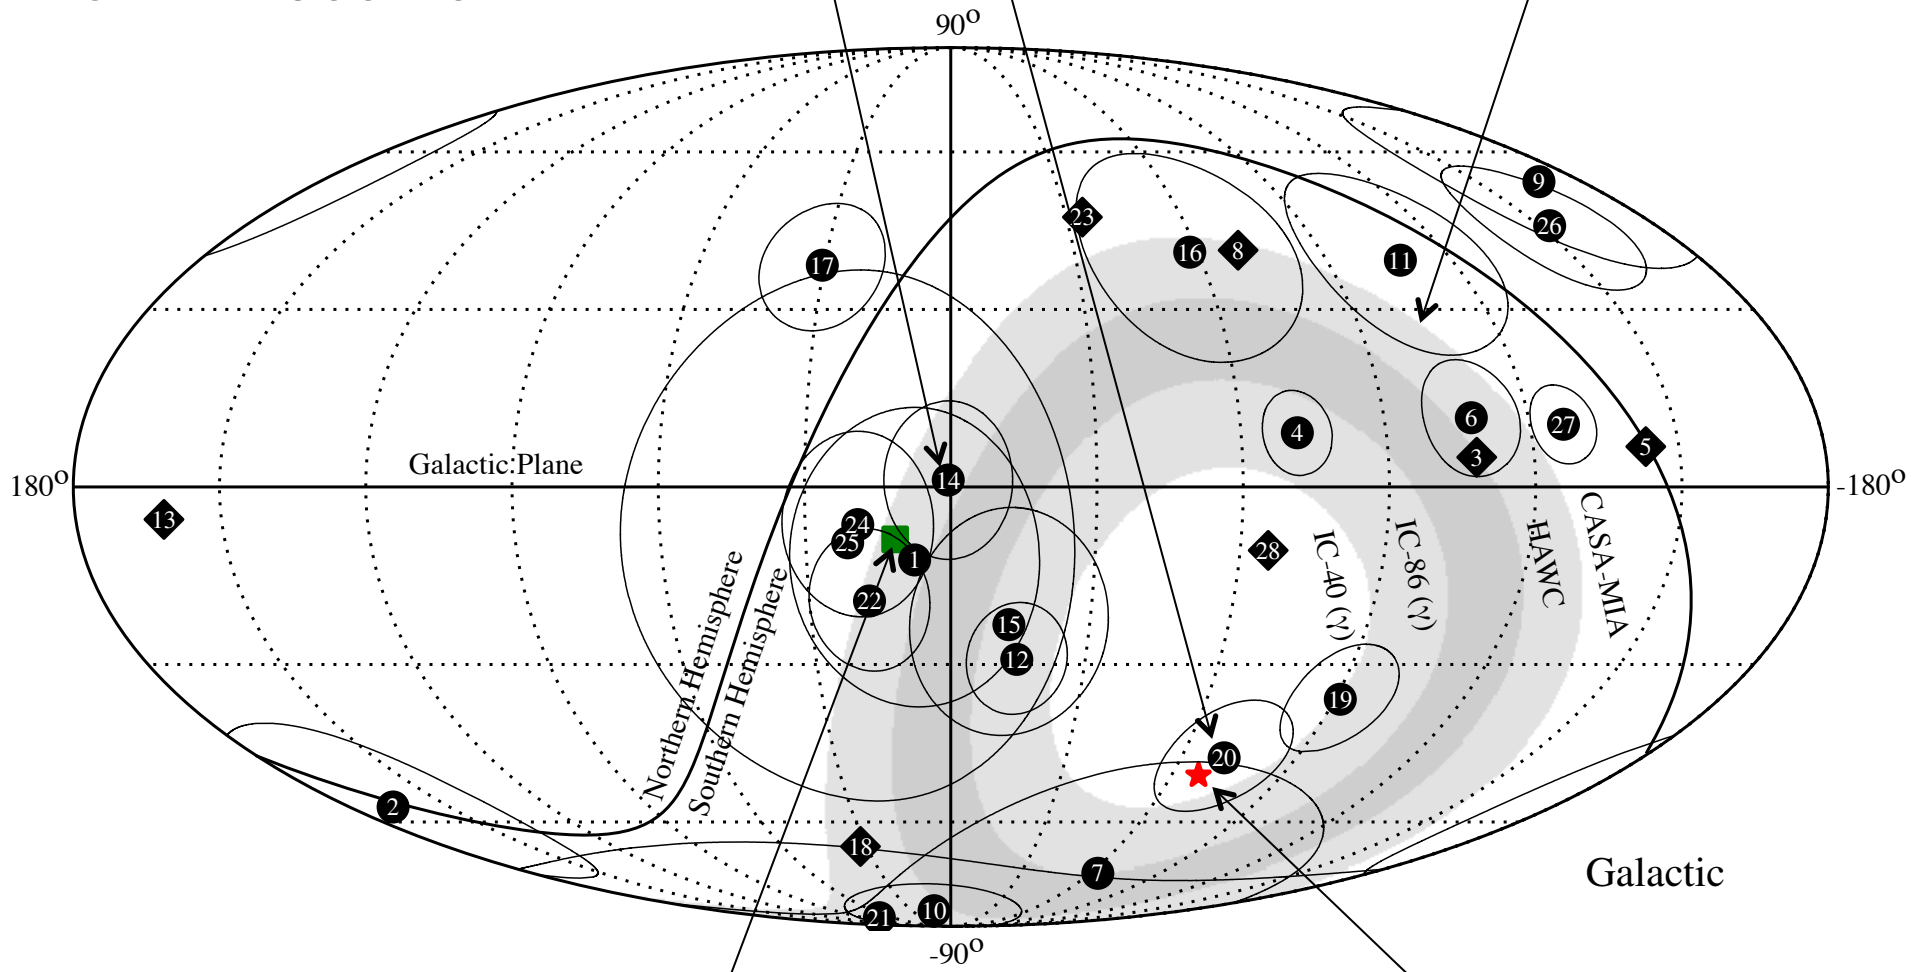

Galactic

Galactic coordinates arXiv 1309.4077

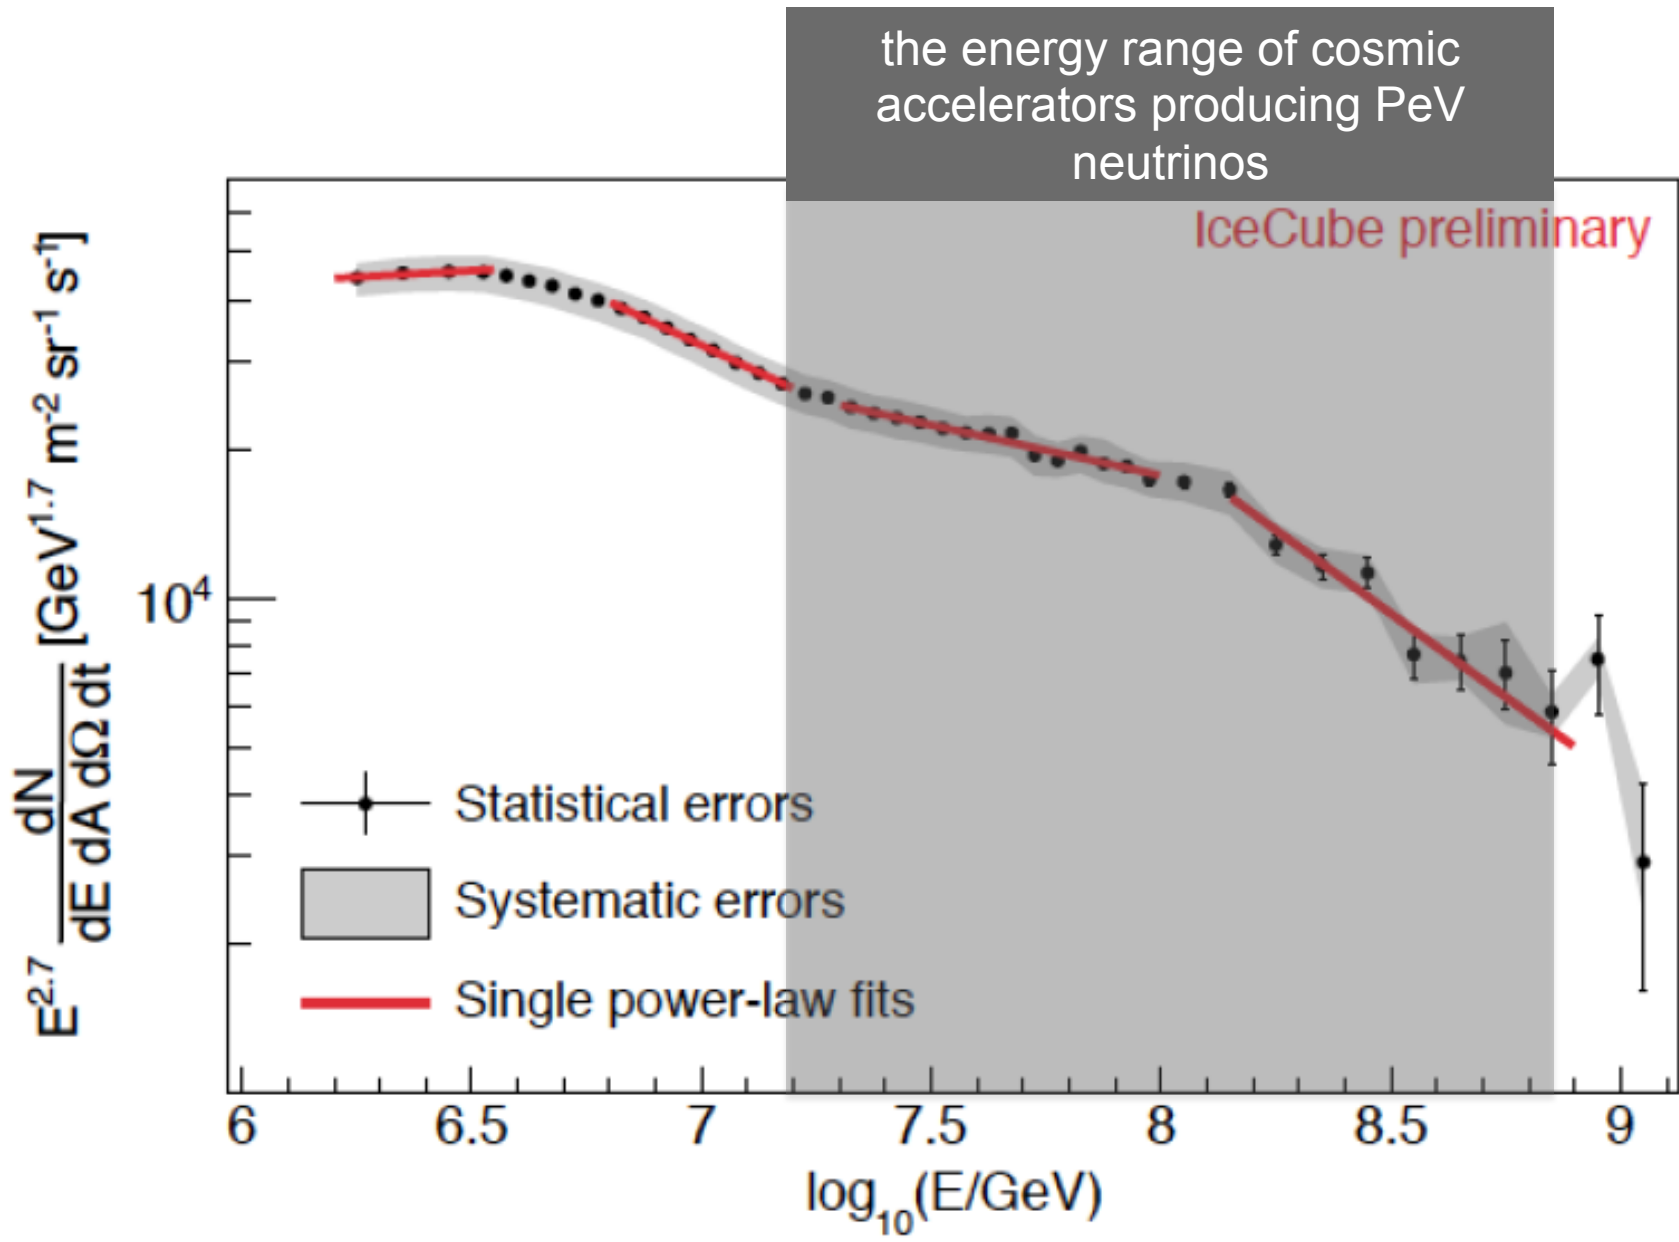

PeV events

boundary with no gamma ray observations in Southern sky

c.o.g of 5-event cluster

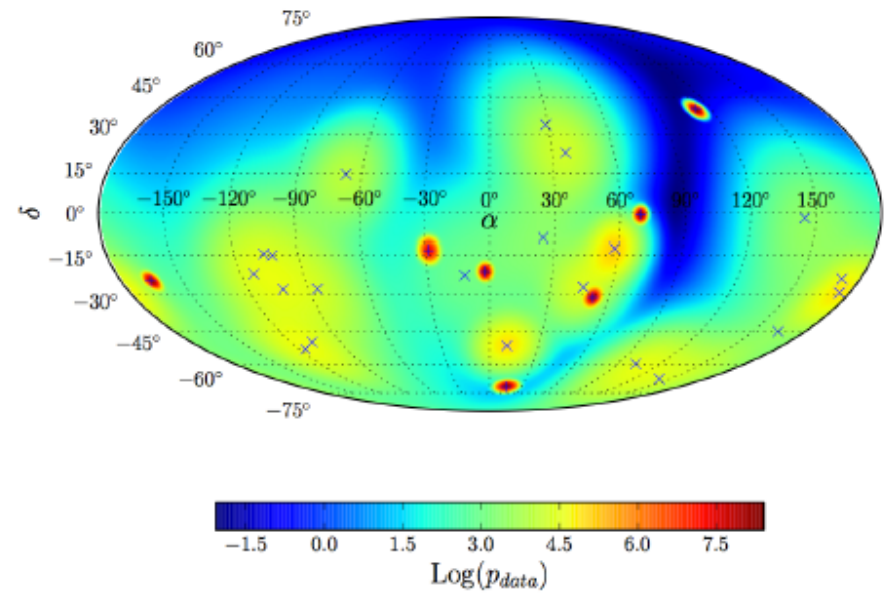

hottest spot in IceCube
PeV gamma ray map

you have one guess: starburst galaxies ?

expect surprises: produced by Galactic dark matter halo?

where do they come from?

- not all Galactic
- structure of the spectrum applies directly to the accelerator, no cascading like for photons
- where are the PeV photons?
- we may be surprised, it happened before
- need more events: no SCO-X1, more like Martin Ryle's radio stars

Beyond IceCube

francis halzen

- the discovery of high-energy cosmic neutrinos
- where do they come from?
- **neutrino stars?**
- cosmogenic neutrinos
- beyond IceCube
- low threshold frontier (PINGU)

search for point sources of neutrinos

Figure 2: Sky plot of all events that pass level 4 quality cuts.

Atm. neutrinos
Atm. muons

auto correlation: detect association with known sources

total number of events required to observe n-events multiplets from the closest sources is

$$370 \times n \times \left[\frac{\rho_0}{10^{-5}} \right]^{\frac{1}{3}} \text{ events}$$

for a observed diffuse cosmic flux and 0.4 degrees angular resolution

examples of local source densities (per Mpc³):

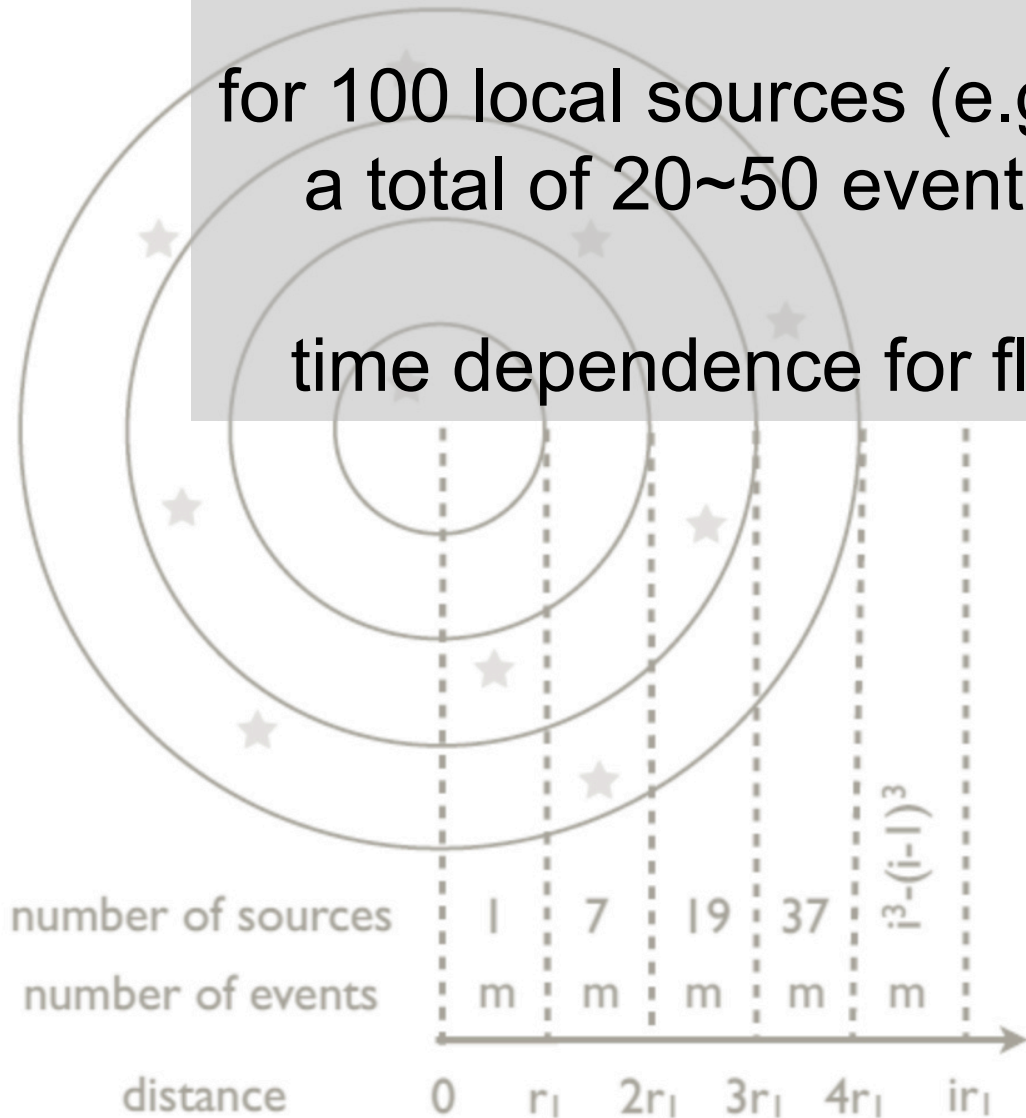

- $10^{-3} - 10^{-2} \text{ Mpc}^{-3}$ for **normal galaxies**
- $10^{-5} - 10^{-4} \text{ Mpc}^{-3}$ for **active galaxies**
- 10^{-7} Mpc^{-3} for **massive galaxy clusters**
- $> 10^{-5} \text{ Mpc}^{-3}$ for **UHE CR sources**

Identification of Extra-Galactic Point Sources?

cross correlation with catalogues:

for 100 local sources (e.g. Auger and TA)
a total of 20~50 events are required

time dependence for flaring sources!

- total number of sources

$$n \sim 10^6 - 10^7$$

- total number of "slices"

$$(n_s)^{\frac{1}{3}}$$

- total number of events

$$\bar{N} \simeq m \times n_{\text{slice}} = m \times (n_s)^{\frac{1}{3}}$$

- ✓ required number of events to see a doublet ($m = 2$)

$$\bar{N} \simeq 200 - 500$$

- ✗ random clusters are very likely with bad angular resolution!

a next-generation IceCube with a volume of 10 km^3
and an angular resolution of < 0.5 degrees will
identify the sources of a “diffuse” flux in several years
and guarantee astronomy.

Beyond IceCube

francis halzen

- the discovery of high-energy cosmic neutrinos
- where do they come from?
- neutrino stars?
- **cosmogenic neutrinos**
- beyond IceCube
- low threshold frontier (PINGU)

cosmic rays interact with the
microwave background

cosmic rays disappear, neutrinos with
EeV (10^{18} eV) energy appear

1 event per cubic kilometer per year
...but it points at its source!

~1 event per year in IceCube, PAO and ARA

cosmogenic neutrinos: an event

Livingston plot :
energy versus year
(Salzberg)

“GZK v beam”
($E_{CM} \sim 100-200$ TeV)

LHC

ILC

~ 5 events per year
in next-generation
IceCube

- ARA - IceCube coincidences
- joint PeV-EeV search
- ultimate beyond the SM measurement

Hybrid event example: 10^{19} eV neutrino, 3.5×10^{18} eV shower
 6.5×10^{18} eV lepton

Beyond IceCube

francis halzen

- where do they come from?
- neutrino stars?
- cosmogenic neutrinos
- **beyond IceCube**
- low threshold frontier (PINGU)

absorption length

← 220m →

most transparent solid
in Nature...or laboratory

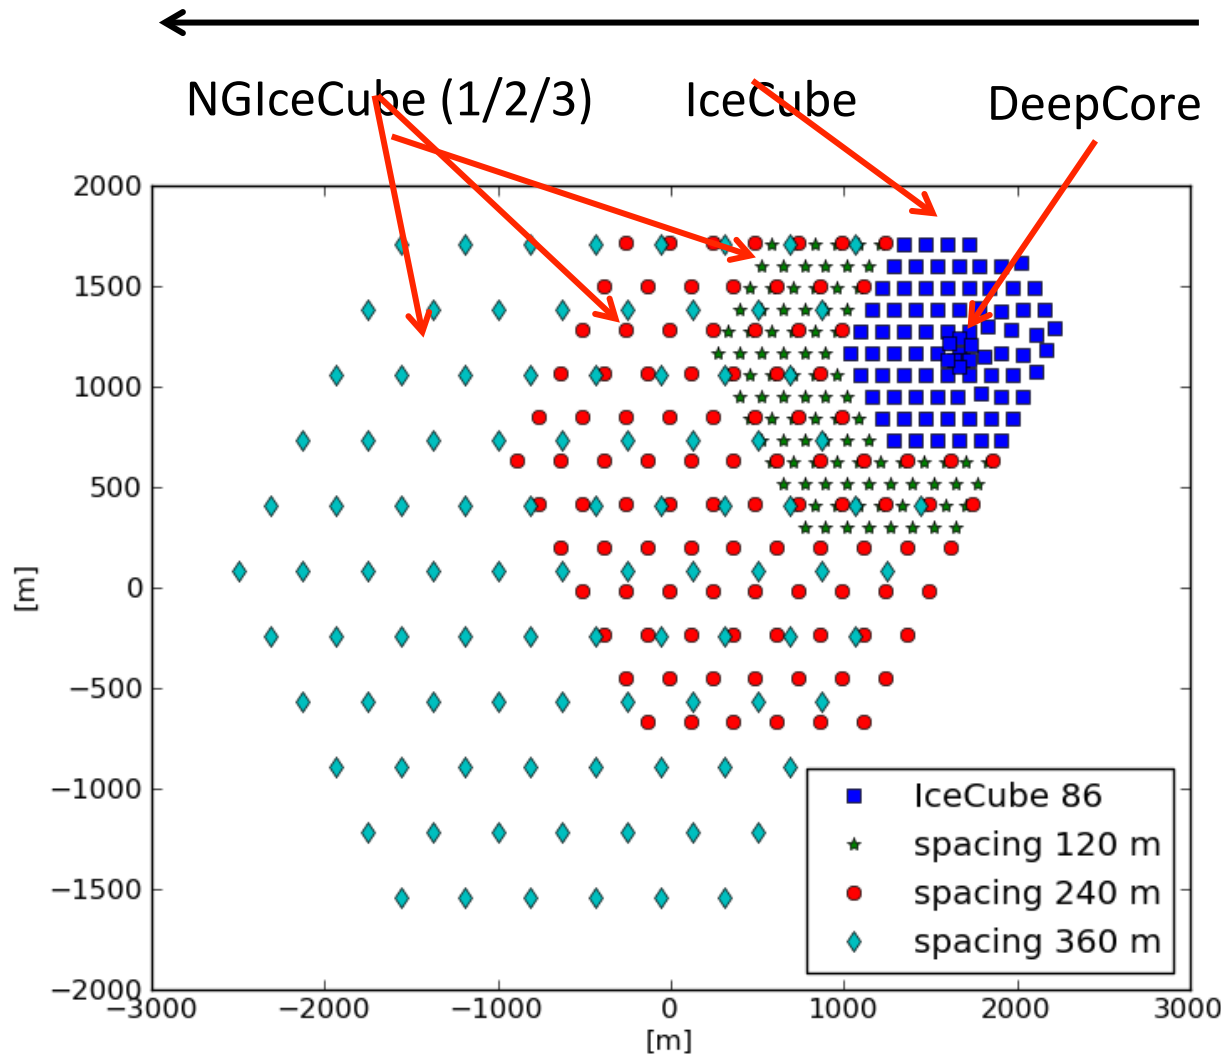

scattering length

← 47m →

measured optical properties → twice the string spacing

(increase in threshold not important: only eliminates energies where atmospheric background dominates)

Spacing 1 (120m):
IceCube (1 km³)
+ 98 strings (1,3 km³)
= 2,3 km³

Spacing 2 (240m):
IceCube (1 km³)
+ 99 strings (5,3 km³)
= 6,3 km³

Spacing 3 (360m):
IceCube (1 km³)
+ 95 strings (11,6 km³)
= 12,6 km³

120 strings
Depth 1.35 to 2.7 km
80 DOMs/string
300 m spacing

neutrinos: the sun and the Earth

Symmetry Magazine

$$\nu_3 = \left(\frac{\nu_\mu + \nu_\tau}{\sqrt{2}} \right) + |s_{13}| e^{i\delta} \nu_e$$

$$\nu_2 = \sin\theta_\odot \nu_e + \cos\theta_\odot \left(\frac{\nu_\mu - \nu_\tau}{\sqrt{2}} \right)$$

$$\nu_1 = -\cos\theta_\odot \nu_e + \sin\theta_\odot \left(\frac{\nu_\mu - \nu_\tau}{\sqrt{2}} \right)$$

oscillations in DeepCore [> 5 sigma]

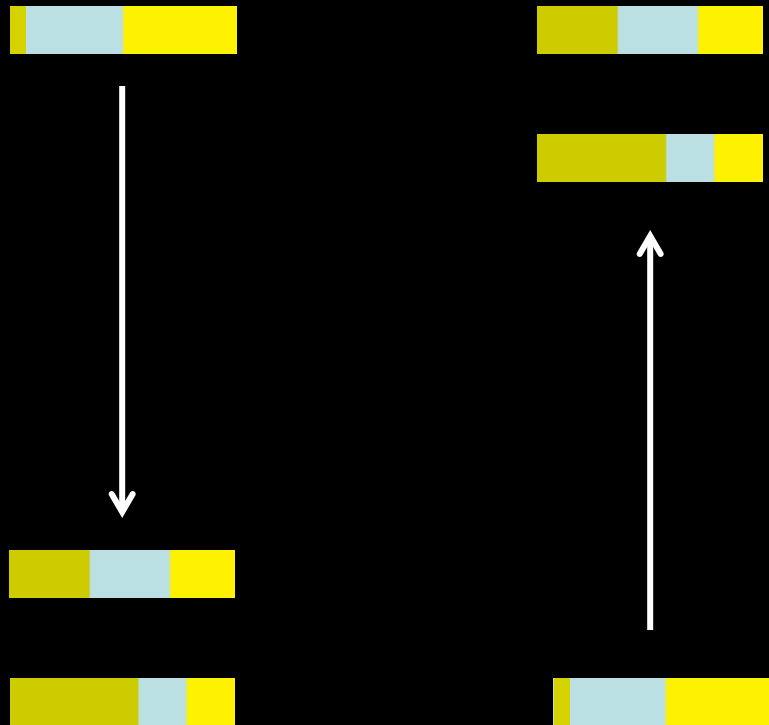

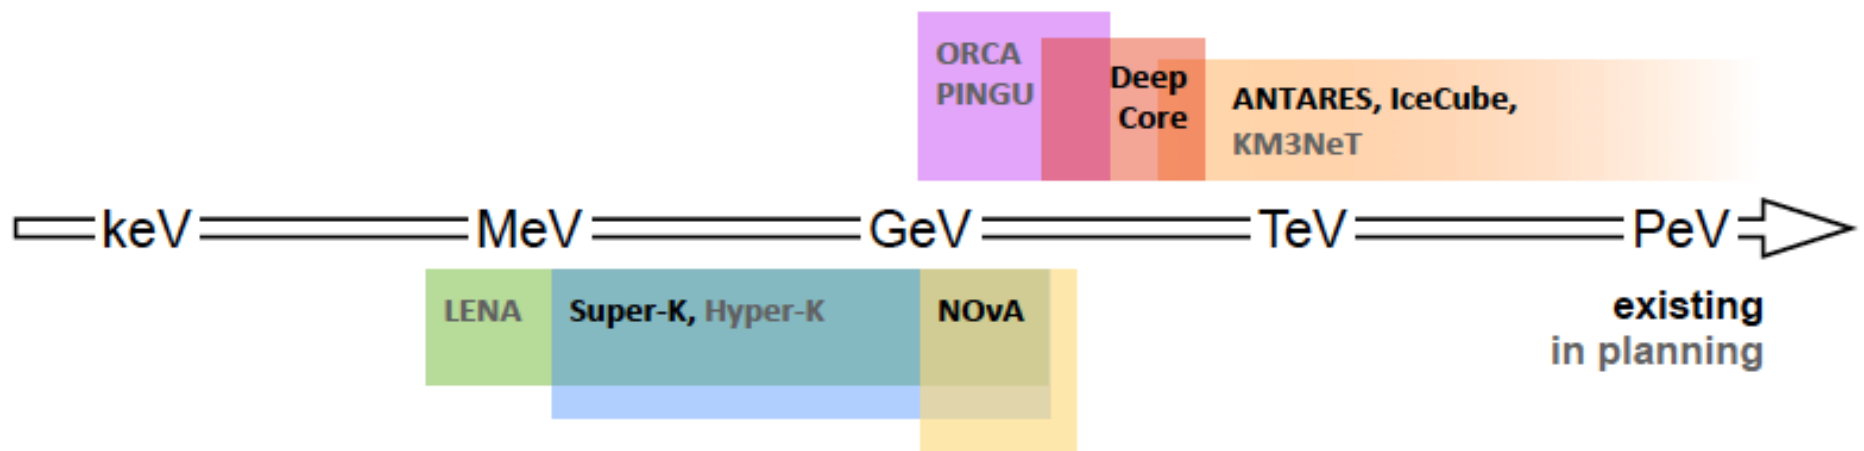

neutrino oscillations in Deep Core

resonance in effective θ_{13} angle traversing the Earth diameter at 10 GeV

hierarchy: sign Δ_{13} ?

$m(\nu_e)$ $m(\nu_\mu)$ $m(\nu_\tau)$

- ▶ First maximum for $P(\nu_\mu \rightarrow \nu_\mu)$ @ 12 GeV (L = Earth diameter)
- ▶ For $\bar{\nu}$ NH and IH approximately swapped → effect cancels if $N(\nu) = N(\bar{\nu})$
- ▶ Fortunately, $\Phi(\nu_{\text{atm}}) > \Phi(\bar{\nu}_{\text{atm}})$ and $\sigma(\nu) > \sigma(\bar{\nu})$

Mena et al., arXiv:0803.3044

~ 8 GeV : hierarchy revealed by
“large” matter effects in the Earth

$$\sin^2 2\theta_{13}^m = \frac{\sin^2 2\theta_{13}}{\sin^2 2\theta_{13} + \left[\cos 2\theta_{13} \pm \frac{\sqrt{2G_F n_e}}{\Delta_{13}} \right]}$$

(mostly) neutrino + antineutrino -

sign Δ_{13} : hierarchy !

(a) Baseline PINGU geometry.

low energy infill:
PINGU

(b) Signal and background.

PINGU:
 low-mass dark matter

Next-Generation IceCube

- capitalize on discovery
- astronomy guaranteed
- ~ 120 strings: more sensors per string with higher quantum efficiency
- proven techniques, low risk
- flexibility of deployment per seasons: optimization
- cost similar to original detector
